Evahan2026 Competition Guidelines (2026.1.29)

I. Competition Process and Key Timelines

Registration Deadline: January 30, 2026

Test Data Release: February 3, 2026

Submission Deadline: February 9, 2026, 23:59 (UTC+8)

Technical Report Submission Deadline: February 28, 2026

Notification of acceptance: March 1, 2026

Camera-ready papers due: March 10, 2026

II. Competition Format

1. Closed Mode (Mandatory and Required): Only the training data provided by us + baseline models (Qwen2.5-VL-7B-Instruct or Xunzi_Qwen2-VL-7B-Instruct) are permitted. Participants must use one of these models to complete all evaluation tasks.

2. Open Mode (Optional): No restrictions on external resources, data, or models. Participants may use different models to train on the three datasets, but must fully disclose all selected resources and methods in the technical report.

The final ranking will primarily be based on the closed mode, with the open mode serving as a reference. Submissions will be ranked according to a specific ratio. Participants may submit a total of three times across both modes, with the final score determined by the most recent submission.

III. Submission Format

For datasets A and C, perform plain text recognition tasks and submit results in **JSON format**. The output must include the **"image_path" and "text" fields**, with recognition order proceeding top-to-bottom and right-to-left.

```
[
    {
        "image_path": "image_name",
        "text": "text"
    },
    ……
]
```

Dataset B is solely for layout information recognition tasks. Submissions must also be in **JSON format** and include the two primary fields: **"image_path" and "regions"**. Within "regions", the following fields are required: **"label" and "points"**. The "text" field is optional. During evaluation, only 'label' and "points" will be utilized.

- "label": For comprehensive consideration, layout information in this competition is categorized into four types: **book_edge, image, seal, and text**. Other categories are considered errors. See Figure 1 for examples.
- "points": Refers to the coordinates of the annotation box. In the training dataset, the origin of each image's coordinate system is located at the top-left corner, and annotations are based on rectangular boxes, meaning there are 4 coordinate points. See Figure 2 for an example.
- Correspondence: The "label" tag must precisely correspond to the "points" coordinate frame.

```
[
  {
      "image_path": " image_name",
      "regions": [
          {
              "label": "book_edge",
              "text": "",
              "points": [ [x1, y1], [x2, y1], [x2, y2], [x1, y2] ]
           },
          {
              "label": "text",
              "text": "text",
              "points": [ [x1, y1], [x2, y1], [x2, y2], [x1, y2] ]
           },
          ……
      ]
  },
  ……
]
```

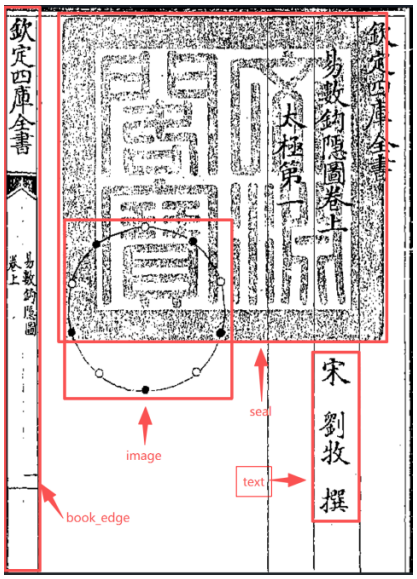
Final Submission Format:

Test sets A, B, and C correspond to training sets A, B, and C, respectively. Submit three corresponding **JSON files** named **"TestA.json", "TestB.json", and "TestC.json"** according to the specified format. Additionally, an **explanatory document** must be submitted, briefly outlining the training methodology, the models and data used, and reproducible code. Finally, bundle the above **four files** into a single folder using the naming format: **ID + Team Captain Name + Competition Mode**.

IV. Key Issues

1. Image Orientation: It needs to be converted to the normal reading order. We provide a batch conversion script (image_rotate.py), but you may also choose other methods.

2. Annotation Issues in Dataset B: For dataset B, we will not test the accuracy of text recognition. Therefore, oversights in text annotation may occur within the training set. During training, participants need only focus on identifying layout elements within dataset B.



3. Accuracy Assessment in Text Recognition:

① **Encoding issue:** Set to multi-encoding format, with the actual character glyphs appearing in the image taking precedence.

② **Variant Character Issues:** Some variant characters in the images may be difficult to identify. We will establish a dedicated variant character correspondence table for this purpose. For example, if the character "尚" in an image is recognized as "尚," we will still consider it correct.

4. Placeholder: In the test, the original placeholders in the images, as well as placeholders required for text that could not be clearly identified, are represented by square boxes "□".
